ABSTRACT

PURPOSE: To easily specify an intersection to be guided next in a recommended path on a map being displayed on a screen.

CONSTITUTION: When a destination is inputted to a man-machine interface device 1 by a remote control key 15, a recommended path is calculated by a path calculation device 3. The current position of a vehicle is constantly detected by a position detection device 5 and the driving of the vehicle is confirmed by a driving monitoring device 17. When approach to the intersection to be guided next is detected by the position detection device 5, a path guiding device 19 reads out such intersection attachment information as **landmark** information from a **CD** device by a **CD** data read controller 21. When the vehicle further approaches the intersection, the information is sent to the man-machine interface device 1. Then, the **landmark** information appears on the map of the displayed screen by a display 25 by the man-machine interface device 1.
